

Register & Login/out System

A framework of register & login/out system of common website/app.(This one is particularly used for health test)

This framework is based on mysql and flaskr, and is mainly designed for my database course.

It helps understand the system of user registration and how the database works properly to protect users' information (such as turning the password into MD5 code in case the database is hacked).

example

First activate the virtualenv by

```
1. . bin/activate
```

then run the py code

```
▶ python run.py
* Running on http://127.0.0.1:5000/ (Press CTRL+C to quit)
* Restarting with stat
* Debugger is active!
* Debugger pin code: 334-518-604
```

type the website in your browser and come with the register page

then u r free to test the system like try registering a username and a new scheme will automatically formed in your mysql.

Here are the unhealthy users

Username: lxf Sex: F E-mail: 12334444@qq.com Height: 170 Weight: 80BMI: 27.0

Username: wcd2 Sex: M E-mail: 154393241@qq.com Height: 181 Weight: 30BMI: 9.0

u can also look it up in the website instead of mysql.

This is a beginner's work! Looking forward to suggestion! :) |
